

If the electrolyte level is low, disconnect the negative (-) terminal lead (7) from the battery first, then disconnect the positive (+) terminal lead (8).

Disconnect the battery breather tube (9). Pull out the battery. Remove the battery filler caps (10).

Carefully add distilled water to the UPPER level mark, using a small syringe or plastic funnel.

(4) Separator  
(5) UPPER LEVEL  
(6) LOWER LEVEL  
(7) Negative terminal

(8) Positive terminal  
(9) Breather tube  
(10) Filler caps

#### **CAUTION:**

- \* When checking the battery electrolyte level or adding distilled water, make sure the breather tube is connected to the battery breather outlet.
- \* Use only distilled water in the battery. Tap water will shorten the service life of the battery.
- \* Filling the battery above the UPPER LEVEL line may cause the electrolyte to overflow, resulting in corrosion to engine or frame parts. Immediately wash off any spilled electrolyte.
- \* The battery breather tube must be routed as shown on the label. Do not bend or twist the breather tube. A bent or kinked breather tube may pressurize the battery and damage its case.
