

## Adjusting Idle Speed

### NOTE:

Do not try to compensate for faults in other systems by adjusting the carburetor.

### To adjust the idle speed:

1. Warm up the engine. The engine must be warm for accurate idle adjustment. Ten minutes of stop-and-go riding is sufficient.
2. Adjust idle speed by turning the throttle stop screw (Fig. 4-8).  
Idle Speed:  
 $1,400 \pm 100$  rpm
