

Repairing a flat tyre or changing a tyre requires special tools and technical experience. We recommend that this type of service be performed by your dealer.

After an emergency repair, have your tyre / wheel inspected by your dealer.

Tube repair and replacement

If you puncture a tyre or damage an inner tube, it must be replaced as soon as possible. A tube that is repaired may not have the same reliability as a new one, and it may fail while you are riding.

If you need to make a temporary repair by patching a tube or using an aerosol sealant, ride cautiously at reduced speed and replace the tube before you ride again.

The tyre must be carefully inspected as described every time the tube is replaced.

⚠ WARNING

It can be hazardous to ride the motorcycle with a temporary repair of the tyre or inner tube. If the temporary repair fails, you can have an accident in which you could be seriously hurt or even killed.

If you must ride with a tyre or inner tube that has been temporarily repaired, ride slowly and be careful not to exceed 50 km/h until the tyre is replaced.
