

If Your Honda SXS Becomes Immersed in Water

If your Honda SXS becomes immersed in water (water level is above the floorboard), inspect the vehicle to avoid severe engine damage by following these steps:

1. Move your Honda SXS to dry land or at the very least, to a water level below 10 inches (25 cm).
2. Check the sub air cleaner condition.

UNDER FRONT HOOD

- If the sub air cleaner is wet, water may have entered the air intake system. Do not start engine.
- If the sub air cleaner is dry, the engine can be restarted.

3. Take your Honda SXS to your dealer for service as soon as possible, even if you succeeded in starting the engine.
